

BAA Meteor Section / NEMETODE Workshop Meeting

Saturday 27th September 2014
10:00 – 16:30 BST

The Macdonald Birmingham Hotel
126 New Street
Birmingham
B2 4JQ

www.britastro.org
www.nemetode.org

- Opening Remarks
- Introductions
- Agenda Review
- Expectations
- Logistics

Definitions:

Meteoroid:

A small body moving in the solar system that would become a meteor if it entered the earth's atmosphere.

Meteor:

A small body of matter from outer space that enters the earth's atmosphere, becoming incandescent as a result of friction and appearing as a streak of light.

Meteorite:

A piece of rock or metal that has fallen to the earth's surface from outer space as a meteor. Over 90 per cent of meteorites are of rock while the remainder consist wholly or partly of iron and nickel.

Science Objectives

- *What questions can we answer with our data?*

Complications:

- Things change over time
Minutes / Hours / Days / Years / Decades / Centuries
- Showers appear and disappear from view ...
- Shower intensity varies with time ...
- What about sporadics?

Complications:

- Each successive orbit of parent object (comet or asteroid) is slightly different

Complications:

Complications:

- Each successive orbit of parent object (comet or asteroid) is slightly different
- Hence filaments of material deposited in slightly different orbits with each successive revolution around the sun

Differing ejections velocities, Varying starting points

- Having been deposited, individual meteoroid orbits change over time

Perturbations due to gravity, solar wind, radiation pressure

Total: 578 showers, including 95 established, 0 nominated to be established, 95 pro tempore, 0 to be removed.

Considerations:

- Perseids
Consistent Performer, Known for many Centuries
- Geminids
*Is currently the best performing shower
But unknown before 1850*
- How will current showers perform in the future ?
- What meteoroid streams are just beyond earth's orbit?
In coming years will they be perturbed across it?
- Is it happening now?
Poor coverage over large parts of the earth?

Science Objectives

- *What questions can we answer with our data?*
 - Geert Barentsen IMC2014 Conference Summary
 - *<http://www.geert.io/international-meteor-conference-2014-summary.html>*

System Optimisation

- Physical Hardware - General
 - Good Quality Cables & Connectors
Frost & Sunlight
 - Well Secured
Firmly attached to solid base
Tie Wraps / Cable Clips etc
 - Demist Heater
Activate early
Gap between lens and window

System Optimisation

- Multiple Camera Systems

Single PC

Pros

Reduced Power Consumption

Less Physical Space

Reduced Thermal Control Issues

Cons

Increased Unit Cost

Reduced Redundancy

Multiple PCs

Pros

Reduced Unit Cost

Increased Redundancy

Cons

More Physical Space – offset by KVM use

Increased Power Consumption

Increased Thermal Control Issues

System Optimisation

- Computer Software
 - Periodic Re-boot: PC (& Router?)
 - Empty Recycle Bin
 - Check Windows Update
 - Patch Tuesday
- Daytime Hibernation ... or Leave Running 24/7

PC Checklist

- Designed to ensure consistency with pre-built systems
- Common “Technical Support” questions / guidance
 - “Maximum Correction” parameter in Dimension 4*
 - Empty Recycle Bin after deleting false captures*
 - Defragment hard drive(s)*
 - Periodic (preventative) reboots and virus scans*
 - “Green” labelled HDDs: issues with deactivating power saving*
- UFO Capture
 - Include time-zone (e.g. UTC) after date / time overlay*
 - Also suggest including location, camera and lens details*
 - Do not exceed maximum number of characters*
 - Minimise to taskbar when running*

System Optimisation

- Power
 - Separate vs Common PSUs / Linking of 12V DC
 - Timeswitches

Rotary, Electronic, Theben SEL170

System Optimisation

- Power
 - Separate vs Common PSUs / Linking of 12V DC
 - Timeswitches
 - UPS ... *to prevent PC reboot resulting from intermittent, short duration power outages*

System Optimisation

- Video Signal
 - Ground Loop Isolator... *to eliminate rolling banding on video images*
Positioning ... is your video lead an antenna?
Either as video signal exits camera or just before video signal enters PC

System Optimisation

- User Environment
 - Desktops vs Laptops
 - KVM (Keyboard, Video, Mouse) Switches

System Optimisation

- User Environment
 - Desktops vs Laptops
 - KVM (Keyboard, Video, Mouse) Switches
 - To reduce number of Keyboards, Monitors, Mice*
 - Unless you like the “Mission-Control” look*

Timing Corrections

- Rationale
 - Identification of Common Events
 - Astrometry

| Focal Length (mm) | Resolution (arcsec / pixel) |
|-------------------|-----------------------------|
| 3.8 | 494 |
| 6.0 | 313 |
| 8.0 | 235 |
| 12.0 | 156 |

- Techniques
 - Dimension 4
 - Update Frequency; Maximum Correction
 - Minimise – DO NOT CLOSE!

System Optimisation

- Network Switches

Timing Corrections

- Issues
 - Loss of Internet Connection
 - Local vs. Remote vs. Random NTP Servers
 - Large jumps post re-boot
 - Internet activity
 - Simultaneous synchronisation requests
 - Analysis Spreadsheet

Timing Corrections

- Issues

- “Saw-tooth” Pattern

Gordon Reineke 02nd August 2014

[illegible]

Lenses

- Lenses
 - Ideally f0.8 or better
 - $1/2''$ or $1/3''$ or $1/4''$ – match lens to camera sensor size
 - Auto-iris (if manual iris then suggest north facing)
 - Focal Ratio for given Focal Length
$$\Delta_{LM} = 5 * \log_{10} \left(\frac{\text{Aperture 1}}{\text{Aperture 2}} \right)$$
 - Computar
 - Cosmimar / Pentax
 - Panasonic – *but no focus ring!*
- Aberration Compensation Filters
 - Lens Mount Compatibility – mind the step!
 - No: Watec 902DM2S, 902H, 902H2/H3 Supreme
 - Yes: Watec 902H2/H3 Ultimate & 910HX

Lenses

- Lens Iris: Video Drive Auto-Iris vs DC Auto-Iris
 - Will the connector on side of camera drive the lens iris?
 - DC auto-iris: the control circuit resides inside the camera
 - Video auto-iris: the control circuit resides inside the lens
 - Watec 902H does not contain necessary control circuitry
 - Later models (Supreme / Ultimate) do.
- Workaround
 - Apply 12V DC directly to the lens iris
 - Sockets: eBay: <http://www.ebay.com/itm/Lot-10-pcs-4-pin-socket-for-Auto-iris-cctv-camera-NEW-/370290110550?ssPageName=ADME:L:OC:GB:3160>

Resolution

- 768 x 576 or 640 x 480
- Issue with USB based video capture devices
- Default resolution and frame rate (as loaded during manufacture) does not match the requirements of the camera / UFO Capture software.

Resolution – Corrective Workflow (*courtesy of Nick & Alex*)

- Run VirtualDub (I'm using version 1.10.4).
- Select File->Capture AVI.
- Select Device-> and select your camera.
- Select Video->CaptureFilter and then select PAL_I in the dropdown for video standard.
- Select Video->CapturePin and ensure the video standard is PAL_I, the frame rate is 25.00, the colour space is YUY2 and the size is 720x576. Click OK.
- Select Video->crossbar and select "composite in" as the input (assuming you are using composite video).
- Exit VirtualDub.
- Run UFO capture and load the default settings file PF720x576N.ufi. Connect to the camera and you should now have video in native resolution and frame-rate.

Settings & Triggers - From UFO Capture User Guide

Detect Level Noise Tracking

This option is to tune "Detect Lev" automatically by the background noise level.

- *DLratio : ratio(%) between noise level and "Detect Lev".
Normally 105 to 130 is appropriate.*
- *MinDL : Minimum value of "Detect Lev".
Use this to avoid continuous recording - happens when "Detect Lev" become too low .*
- *MinL-N : Minimum difference of "Detect Lev" and noise level.
Use this value to keep margin.*

Detect Size Slider

Set motion detect size threshold level.

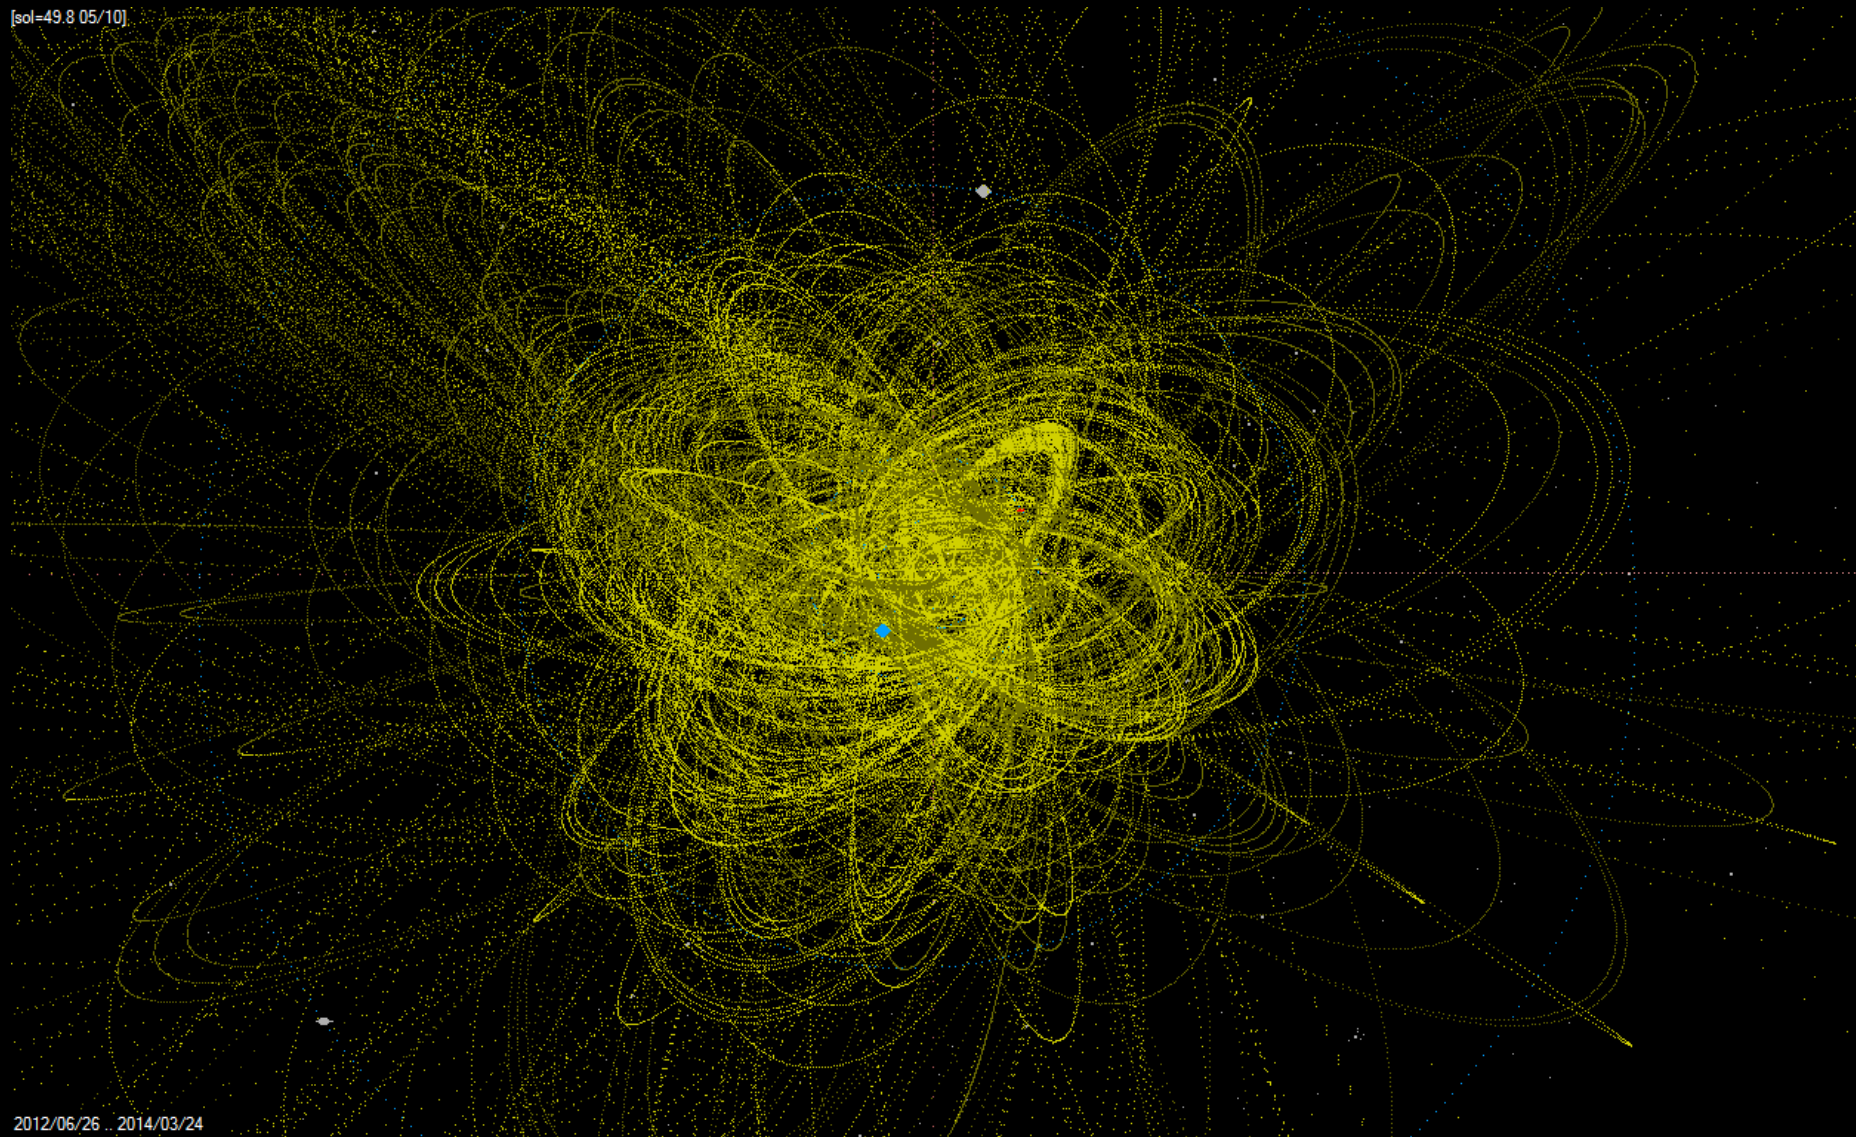

- *When bar exceeds slider position for more than "Min(frm)"time, a trigger will be raised.*
- *Detect Size is number of pixels which change brightness more than Detect Lev threshold*

Spectral Analysis of Meteors

~~Bill Ward~~

William Stewart ... using Bill's slides!

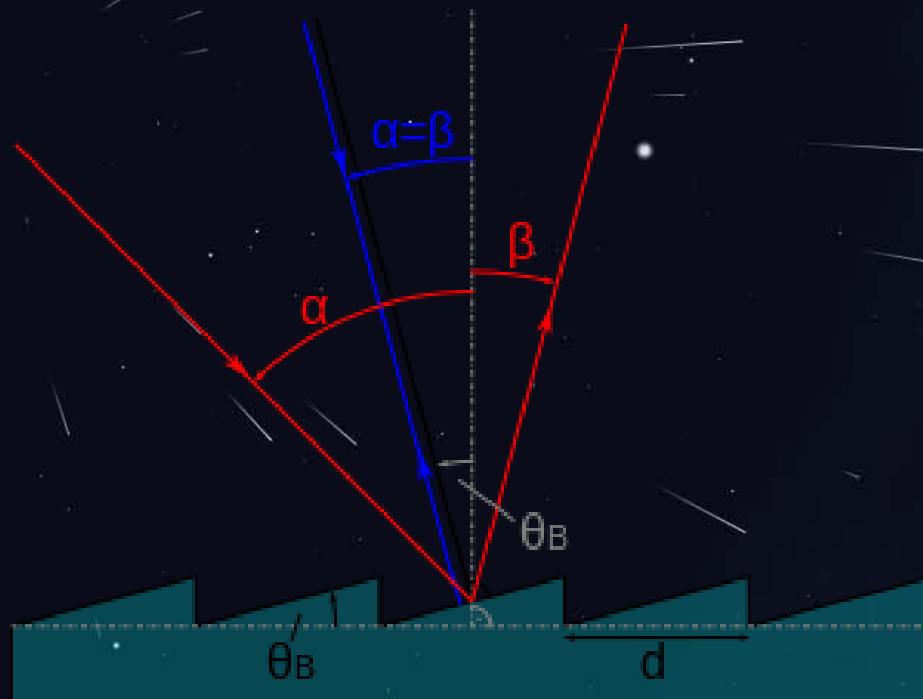

2006/03/29 20:24:21.779(JST) 00001 00000 035 W902HS2M 6mm+50016TK1 66 SonotaCo

Video of spectra from bright meteor (courtesy SonotaCo) obtained
using diffraction grating available at:
[http://sonotaco.sub.jp/report/2006/200603/media/M20060329_20
2422_TK1_G6.wmv](http://sonotaco.sub.jp/report/2006/200603/media/M20060329_202422_TK1_G6.wmv)

- ## Grating Choice

Blazed glass gratings preferable. Better efficiency in one selected order (spectrum). Depends on goals.

- ## Grating Choice

Blazed glass gratings preferable. Better efficiency in one selected order (spectrum). Depends on goals.

- ## Low Resolution (~300 lines per mm)

Good chance of catching all or majority of spectrum. Low line resolution, detail may be lost. Can identify stony types from stony irons from nickel iron types.

- ## Medium Resolution (~600 lines per mm)

Much better line resolution, better for identifying individual lines. Longer spectrum on chip so less chance of catching whole spectrum.

- **High Resolution (>800 lines per mm)**

Common gratings are 830 and 1200 lines per mm

Best for line identification. With good corrections relative line abundances can be derived. Can start to derive mineral composition.

Serious research possibilities. However lower chance on any given system of catching a spectrum.

- **Personal Opinion**

600 lines per mm for regular observational use

300 lines per mm to build up numbers for processing practice

- CCD's and DSLR's can be used as well as video cameras.
Although less efficient than glass blazed gratings, inexpensive plastic grating material will still give excellent results if a bright meteor obliques.

Plastic grating material is available in large 6 x 12 inch sheets in 12500 lines per inch (~492 lines per mm) and 25000 lines per inch (~984 lines per mm).

Can be cut to size and mounted in rotating holders bought from photo suppliers.

Figure 1: Obtain spectrum! Fastest lens possible: f1.2 and 0.8 are OK.
Largest possible aperture for best limiting magnitude.

Figure 2: For processing spectrum must be rotated and slant corrected.
This is for spectrum processing (IRIS package).

Figure 3: Crop image to remove background sky and stars if possible (minimise artefacts in spectrum). Flip image so spectrum runs from blue end at left to red end at right. Prominent atmospheric lines help with this.

Figure 4: Import aligned image into VSPEC and process as required. This will vary from spectrum to spectrum. Again the use of prominent atmospheric lines helps.

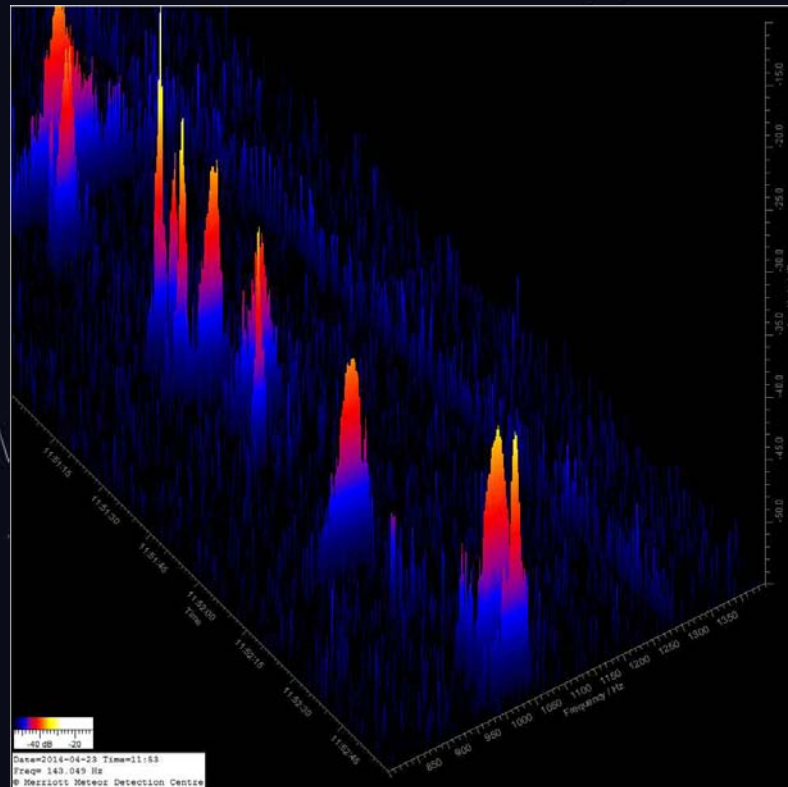

Figure 5: Use flux corrected black body spectrum of bright star to correct for instrument sensitivity. This shows the corrected spectrum compensating for chip sensitivity. Most silicon sensors are much better in near IR as shown by comparison of Figures 4 & Figure 5. The corrected spectrum shows the true appearance of the visible lines.

- Smoke Trails
Probe for upper atmospheric wind velocities

Cuillan Mountain Fireball 14th October 2013:

Video of bright meteor and resultant smoke trail (courtesy Marcus McAdam) and subject of accepted JBAA paper available at:
<https://www.facebook.com/video.php?v=10151629153951370&set=vb.371383149581941&type=2&theater>

Cuillan Mountain Fireball 14th October 2013:

DSLRs

- DSLRs in Widespread Use ...
 - ... but where should they be pointed?*
 - Recommendation: towards regions with extensive video coverage*
 - Rationale is that video allows triangulation*
 - DSLR provides imagery of residual effects*
- Traditional Triangulation Points:

| | |
|-----------------------------------|-----------------------------|
| <i>Scotland & NE England:</i> | <i>Bell Rock Lighthouse</i> |
| <i>Midlands:</i> | <i>Derby</i> |
| <i>South:</i> | <i>Reading</i> |
- DSLRs provide higher angular resolution ...
 - ... but without rotating shutter, no velocity data*
